Morbidity and Mortality

Report

PUBLIC HEALTH SERVICE

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

Prepared by the COMMUNICABLE DISEASE CENTER

MElrose 4-5131

For release August 4, 1961

Atlanta 22, Georgia

Vol. 10, No. 30

Provisional Information on Selected Notifiable Diseases in the United States and on Deaths in Selected Cities for Week Ended July 29, 1961

Poliomyelitis - Reported this week were 38 cases of poliomyelitis, 26 of which were paralytic. Although the incidence continues well below that of recent years, this represents a high in reported cases thus far this year. See Offathy on page 2).

Cumulative tals for the past six weeks and for comparable weaks wring each of the past five years are shown below:

AVG Planyelitis Cases (Cumulative) for Weeks 25 through 30 for 1957 through 1961

450

126

1960 1959 1958 325 823 288 300 1304

Paralytic cases reported over the past six weeks represent but 26 percent of the total reported during a comparable period in 1958, the previous low year in over a decade.

Three additional paralytic cases were reported this week from Frederick County, Maryland, bringing to six the number of paralytic cases occurring in this county thus far this year. Onset dates for these cases range between June 30 and July 15. Five of the six are among unvaccinated individuals. Type III poliovirus has been isolated from two.

The three cases reported from the State of Washington all are from Seattle. Since April, five cases have occurred in Seattle; two cases occurred during April and one each

Figure I CURRENT U.S. POLIO INCIDENCE COMPARED WITH YEARS 1955-1960; APRIL-AUGUST, BY WEEK*

in May, June, and July. Four of the five cases are among adults; two had received two doses of vaccine and one, four doses. The cases are scattered throughout the city. Type III polio virus has been isolated from two patients.

Other cases reported this week show a scattered geographical distribution.

Hepotitis - Reported cases of hepatitis this week totaled 1,119, essentially the same prevalence as during the past five weeks.

Plogue - The death of a sawmill worker on June 30 in Pecos, New Mexico has been confirmed in the laboratory as having been due to Pasteurella pestis. The area of presumed exposure is geographically remote; no additional cases are known. Further studies are in progress.

EPIDEMIOLOGICAL REPORTS

Salmonella typhimurium outbreaks — California, Minnesota

Outbreaks of salmonellosis attributable to the consumption of commercially marketed hollandaise sauce have been reported from Los Angeles, California and St. Paul, Minnesota.

The first cases occurred among two Los Angeles families in mid June. Investigations revealed that a hollandaise sauce served at a common dinner was the suspect vehicle. Cultures of sauce remaining in the jar revealed Salmonella typhimurium. A second family outbreak implicating this same product occurred about a week after the first. Ten bottles of the sauce were subsequently obtained in the Los Angeles area and five of these were reported to have yielded Salmonella typhimurium.

Intensive investigations were carried out by the Food and Drug Administration. The product, Hayden's Hollandaise Sauce (manufactured by Hayden's Hollandaise, Inc., College Point, New York), was found to have been shipped nationwide. A large number of shipments were examined and salmonella organisms were found in lots obtained in San Antonio, Texas; San Francisco, California; and Washington, D. C. Attempts to identify particular shipments as suspect proved fruitless when it was found that the codes used on the shipping cases were meaningless.

Subsequently, an outbreak of enteritis was reported among four of six members of a St. Paul, Minnesota (Continued on page 8.)

The chart shows the number of deaths reported for 117 major cities of the United States by week for the current year, a 5-week moving average of these figures plotted at the central week, and an adjusted average for comparison. For each region the adjusted average was computed as follows: From the total deaths reported each week for the years 1956-1960, 3 central figures were selected by eliminating the highest and lowest figure reported for that week. A 5-week moving average of the arithmetic mean of the 3 central figures was then computed with adjustment to allow for population growth in each region. The average value of the regional increases was 2 percent which was incorporated in the adjusted average shown in the chart.

Table 4 shows the number of death certificates re-

ceived during the week indicated for deaths that occurred in selected cities. Figures compiled in this way, by week of receipt, usually approximate closely the number of deaths occurring during the week. However, differences are to be expected because of variations in the interval between death and receipt of the certificate and because of incomplete reporting due to holidays or vacations. If a report is not received from a city in time to be included in the total for the current week, an estimate is used.

The number of deaths in cities of the same size may also differ because of variations in the age, race, and sex composition of the populations and because some cities are hospital centers serving the surrounding areas. Changes from year to year in the number of deaths may be due in part to population increases or decreases.

Table 3. DEATHS IN SELECTED CITIES BY GEOGRAPHIC DIVISIONS

(By place of occurrence and week of filing certificate. Excludes fetal deaths. Data exclude figures shown in parentheses in table 4)

Figures shown in parenthesis are from cittes which have been reporting less than five years and hence are not included in Table 3.

Morbidity and Mortality Weekly Report

family, On July 5 the family had eaten a dinner which included broccoli with hollandaise sauce. All who consumed the broccoli had become ill. Salmonella typhimurium was isolated from fecal specimens obtained from two of the patients and from two opened, partially used jars of the Hayden's Hollandaise Sauce. The sauce had been purchased about June 15 and refrigerated until served.

The manufacturing firm discontinued production on June 21. On July 12, a press release was issued by the Food and Drug Administration warning consumers to destroy any jars in their possession and asking dealers to stop further sale.

(Reported by Dr. Herbert H. Cowper, Director, Communicable Disease Control Division, Los Angeles City Health Department; Dr. D. S. Fleming, Director, Division of Disease Prevention and Control, Minnesota Department of Health; and Food and Drug Administration, Department of Health, Education, and Welfare.)

Staphylococcal Food Poisoning - Ohio

In late June, ten cases of staphylococcal food poisoning occurring among four entirely unrelated groups of people in two counties were found to relate to the consumption of a commercially prepared ham loaf. The loaves had been purchased from three different stores but produced by a single packer.

Investigation of the packing house and its workers revealed that one of the workers who handled the suspect product after cooking was a nasal carrier of a staphylococcus, phage strain 6/53/75/77/83. Numerous samples of the suspected product grew staphylococci of the same phage type and an organism of the same strain was isolated from the stool of one of the patients.

(Reported by Winslow J. Bashe, Chief, Division of Communicable Diseases, Ohio Department of Health.)

SOURCE AND NATURE OF MORBIDITY DATA

These provisional data are based on reports to the Public Health Service from the health departments of each State and Puerto Rico. They give the total number of cases of certain communicable diseases reported during the week usually ended the preceding Saturday. Total figures for the United States and the Pacific Division include data for the States of Alaska and Hawaii. Cases of anthrax, botulism, and rabies in man are not shown in table 2, but a footnote to table 1 shows the States reporting these diseases. When diseases of rare occurrence are reported by a State (cholera, dengue, plague, louse-borne relapsing fever, smallpox, louseborne epidemic typhus, and yellow fever) this is noted below table 1.
